Topics

- 1. Orientations**
- 2. Medical Imaging**

Directions (1)

TABLE 1.1 Orientation and Directional Terms

Term	Definition	Example
Proximal	Closer to the origin of the body part or the point of attachment of a limb to the body trunk	 The elbow is proximal to the wrist
Distal	Farther from the origin of a body part or the point of attachment of a limb to the body trunk	 The knee is distal to the thigh
Superficial (external)	Toward or at the body surface	 The skin is superficial to the skeletal muscles
Deep (internal)	Away from the body surface; more internal	 The lungs are deep to the skin

*Whereas the terms *ventral* and *anterior* are synonymous in humans, this is not the case in four-legged animals. *Ventral* specifically refers to the "belly" of a vertebrate animal and thus is the inferior surface of four-legged animals. Likewise, although the dorsal and posterior surfaces are the same in humans, the term *dorsal* specifically refers to an animal's back. Thus, the dorsal surface of four-legged animals is their superior surface.

Directions (2)

- 1. superior/cranial/cephalad**
- 2. inferior/caudal**
- 3. anterior/ventral**
- 4. posterior/dorsal**
- 5. medial**
- 6. lateral**
- 7. proximal**
- 8. distal**
- 9. superficial**
- 10. deep**
- 11. intermediate**

Landmarks/Body Regions

(a) Anterior

(b) Posterior

Anterior Body Regions (1)

- | | | |
|------------------------|---------------------|----------------------|
| 1. abdominal | 11. digital | 21. palmar |
| 2. acromial | 12. crural | 22. patellar |
| 3. antebrachial | 13. femoral | 23. pedal |
| 4. antecubital | 14. frontal | 24. pelvic |
| 5. axillary | 15. inguinal | 25. peroneal |
| 6. brachial | 16. mammary | 26. pubic |
| 7. buccal | 17. mental | 27. sternal |
| 8. carpal | 18. nasal | 28. tarsal |
| 9. cervical | 19. oral | 29. thoracic |
| 10. coxal | 20. orbital | 30. umbilical |

Anterior Body Regions (2)

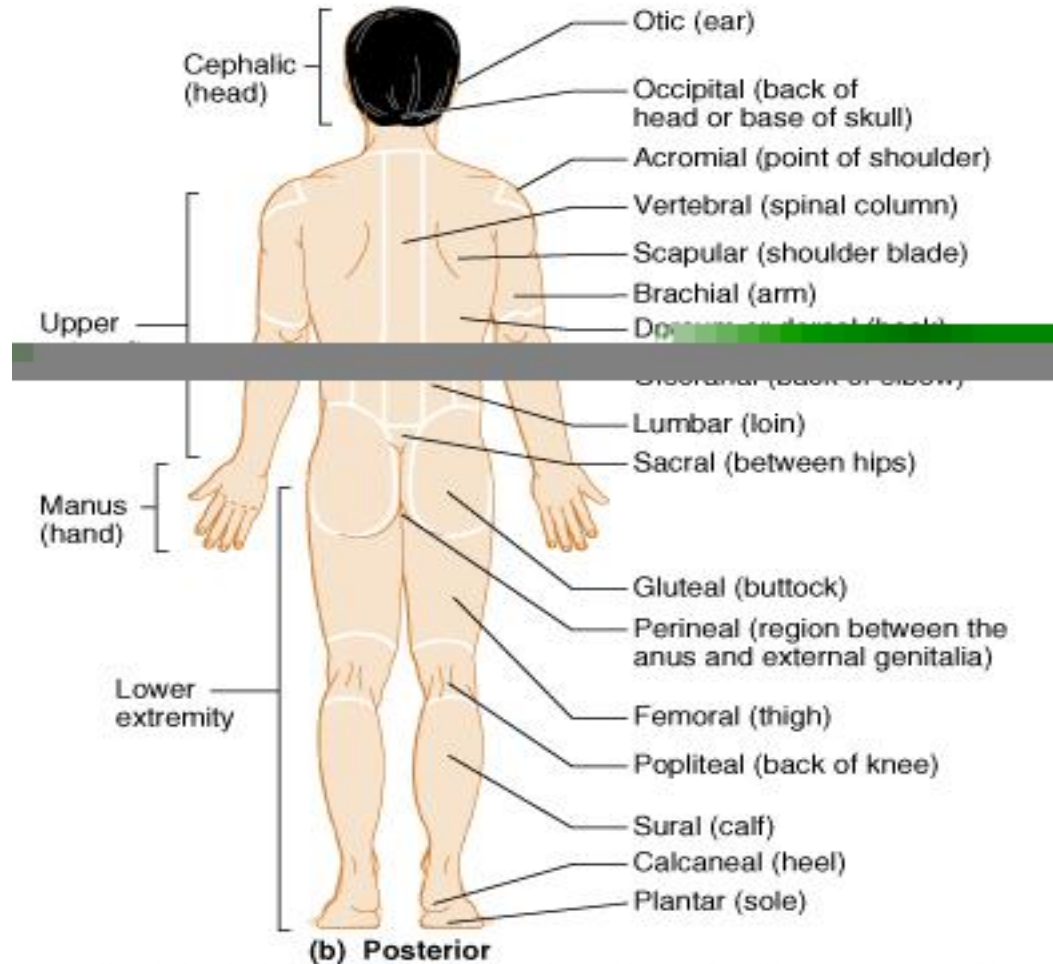

Copyright © 2001 Benjamin Cummings, an imprint of Addison Wesley Longman, Inc.

Posterior Body Regions (1)

- | | |
|----------------------|----------------------|
| 1. acromial | 11. otic |
| 2. brachial | 12. perineal |
| 3. calcaneal | 13. plantar |
| 4. cephalic | 14. popliteal |
| 5. dorsal | 15. sacral |
| 6. femoral | 16. scapular |
| 7. gluteal | 17. sural |
| 8. lumbar | 18. vertebral |
| 9. occipital | |
| 10. olecranal | |

Posterior Body Regions (2)

Copyright © 2001 Benjamin Cummings, an imprint of Addison Wesley Longman, Inc.

Planes/Sections (1)

Copyright © 2001 Benjamin Cummings, an imprint of Addison Wesley Longman, Inc.

Planes/Sections (2)

- 1) sagittal: vertical, lengthwise cut**
-> right and left sections

- 2) frontal or coronal: vertical, lengthwise cut**
-> anterior and posterior sections

- 3) transverse or horizontal: horizontal cut**
-> superior and inferior sections

Body Cavities (1)

1) dorsal cavity:

- **cranial & spinal cavity: brain, cord**

2) ventral cavity:

a) **thoracic cavity: lungs, heart**

b) **abdomino-pelvic cavity:**

- **stomach, liver, intestines**

- **genitalia, bladder, rectum**

Body Cavities (2)

(a) Lateral view

(b) Anterior view

Key:

-  Dorsal body cavity
-  Ventral body cavity

Orientation Assignment*

Draw and label:

- 1) directions (11)**
- 2) landmarks/body regions**
 - anterior (30), posterior (18)**
- 3) planes/sections (3)**
- 4) body cavities (2)**
 - outline organs inside cavity**

***assignments are due next week**

Medical Imaging

= non-invasive scans into body for diagnosis

Common features:

- 1) EM wave or sound bombardment**
- 2) ingestion of radio-isotopes tagged to organic compounds, eg glucose**
- 3) computer analysis to create visual anatomical images and graphs**

Problem:

- 1) computer-created images are not photographs,**
- 2) inferior to “direct observation”**

X-Ray

procedure:

- **x-ray bombardment**
- **lead shield cover**
- **dense areas absorb more x-rays -> “light areas”**
eg bones & tumors
- **hollow areas absorb less x-rays -> “dark areas”**
eg fat and hollow organs

**advantage: cheap, safe with limited use, direct image,
easily available, produce large area image**

- **used for bone conditions, tumors**

disadvantage: overlapping images, unclear soft tissues

CT/CAT

= computed axial tomography

procedure:

- like x-ray, but beams focus on sections

**advantage: no overlapping areas,
detailed sections only**

- used for head trauma, strokes, abdom. prob.

**disadvantage: high cost for equipment, computer
analysis, and medical diagnosis**

PET

= positron emission tomography

procedure:

- ingest sweet fluid with radio-isotopes tagged to glucose**
- bombard with gamma rays**

advantage:

produce images of metabolic proc., strokes, epilepsy, Alzheimer

disadvantage: high cost for equipment, computer analysis, and medical diagnosis

Ultra-sound

procedure:

- **soundwave bombardment**
- **echo analysis to recreate internal image**

advantage:

- cheap, safe, easy to use**
- **used to monitor fetal development and position**

disadvantage:

- not show air structures (lung) or bone-surrounded structures (brain, cord)**

MRI

**= magnetic resonance imaging
procedure:**

- strong magnet acts on hydrogen present in water (75% of body is water)**

advantage:

- differentiates tissues with different water %
eg gray and white matter in brain, cord**
- penetrates surrounding bone (skull, vertebr.)**
- used for MS plaque detection**

**disadvantage: high cost for equipment, computer
analysis, and medical diagnosis**

- strong magnet, affects metal parts in body**

Medical Imaging Review*

- 1) Compare and contrast the 5 methods
- 2) As a health professional, which method would you select for these injuries? State your reasons.
 - chronic knee pain
 - broken rib
 - heart burn
 - concussion (head)
- 3) Read the article in the text:
“Medical Imaging - Illuminating the body”

***reviews are not collected**
